**DYNAMET TECHNOLOGY/BODYCOTE FORM STRATEGIC ALLIANCE**

Bodycote HIP, North America, a worldwide leader in heat-treating and Hot Isostatic Pressing of materials, and Dynamet Technology, Inc., Burlington, Massachusetts, a pioneer in the development of titanium powder metal alloys and manufacturing technology, have announced the formation of a strategic alliance. The alliance will permit the further commercialization and expansion of the production capability of Dynamet Technology for the supply of its powder metal billet and near-net shape components in titanium, titanium alloys and titanium alloy composites and permit Bodycote to extend application of its isostatic pressing equipment and expertise to the manufacture of finished and semi-finished titanium products. Stanley Abkowitz, CEO of Dynamet Technology indicated that, “this alliance comes at an opportune time since application of the P/M process for manufacture of titanium components will help alleviate the current instability in titanium pricing and delivery which is of great concern to the government and industry. Ed Tenerini, President of the North American HIP Operations and Director of the European HIP Operations, indicated that this alliance would permit greater participation of Bodycote in the titanium product area that is anticipated to have significant growth in the near future.
